

GARDEN diary

February job file

Protect your garden. Protect your environment. Save water. Hortico has a variety of water management solutions to promote water retention and penetration of hard-to-wet soils – improving soil structure and health, whilst saving water.

Water Management

Hortico Water Storage Crystals absorb, store, then release water to plants over time. By mixing the crystals with the soil water is stored near the roots – preventing the soil from drying out and saving water. The crystals hold up to 400 times their

own weight in water and they replenish with each watering, lasting for several years before biodegrading harmlessly.

Hortico Soil Wetter Granules contain a special blend of mineral granules and wetting agents that improve moisture penetration in

water repellent soils and potting mix. Each mineral granule is infused with a wetting agent, which is released in small amounts during rainfall or watering to aid in water penetration. This not only saves water but also promotes plant survival during dry times.

Hortico Soil Wetter Hose-On Liquid 2L is a blend of fast acting wetting agents which promote water penetration of hard-to-wet soils, improving soil structure and health as well as saving water. **This hose-on liquid can also be applied with a watering can during water restrictions** and is ideal for large gardens and lawns.

Hortico Soil Wetter Granules 4L contains a special blend of coir and wetting agent that improve moisture penetration in water repellent soils and potting mix. The coir is infused with a wetting agent, which is released during rainfall or watering to aid water penetration.

This large 4L container is ideal for larger garden areas and for treating numerous pots.

Mulching creates a layer of insulation that holds moisture in the soil and reduces evaporation by up to 50%. Organic mulches also break down to improve the soil, saving on watering and promoting a moist environment in garden beds and pots.

Some products may not be available in all states.
